

UEFA WECIS Women Master Extraction

Prepared: 2026-07-27

Purpose

- Create a single consolidated women's WECIS extraction target while avoiding duplicate counting across overlapping UEFA surveillance publications.
- Count programme-periods and populations, not papers.
- Use source papers only as field-level provenance unless they define the master all-injury programme-period.
- For the ECIS men master, use concept rows only when a supplement adds useful incidence, burden, time-loss, recurrence, mechanism, or exposure detail beyond the S200 all-injury anchor.

Counting Rule

- One overlapping surveillance programme-period contributes once to high-level counts.
- Topic-specific papers cannot add another all-injury count for the same players, seasons, and method frame.
- Topic-specific papers may add missing field-level values such as burden, RTP, recurrence, diagnosis, location, or severity.
- Topic-specific count-only subtype rows are audit-only unless they are needed for a reviewer-requested diagnosis worksheet.
- Do not subtract overlapping periods unless a source directly reports the non-overlapping value.

Source Inventory And Decisions

Study ID	Year	Status	Category	Role	Decision	Notes	Title
S1091	2024	uefa	WECIS women	duplicate alias	Do not create another WECIS extraction or master row; retain S112 as source-of-truth.	The title, DOI, article pagination, 1,527 injuries, 463 injured players, and Table 2 values match S112. The PDF hash differs only because it is a separate downloaded rendition.	UEFA Women's Elite Club Injury Study: a prospective study on 1527 injuries over four consecutive seasons 2018/2019 to 2021/2022 reveals thigh muscle injuries to be most common and ACL injuries most burdensome.
S112	2024	extracted	WECIS women	master anchor	Use as the WECIS women all-injury source.	Separate master because sex, programme start, and surveillance period differ from men ECIS.	Hallen A. and Tomas R. and Ekstrand J. and Bengtsson H. and Van den Steen E. and Hagglund M. and Walden M. AO - Hallen et al. - 2024 - UEFA Women's Elite Club Injury Study a prospective study on 1527 injuries over four consecutive sea.pdf

Field-Level Provenance Requirements

- Each extracted value must record source study ID, page/table/figure, source role, direct-vs-derived status, and overlap decision.
- If a value is taken from a supplement paper, record why the master source did not already cover that field.
- If the same metric appears in two overlapping papers, prefer the broadest all-injury master unless the supplement reports a more specific row that matches the extraction field.
- If source definitions differ, split into a separate population/programme-period row instead of merging.

Reviewer Checklist

- Confirm all source IDs in the PDF have been reviewed against full text or reliable extracted text.
- Confirm no ordinary UEFA source paper remains in the analytical export alongside this master record.
- Confirm all source-only and already-included papers are marked in the provenance ledger.
- Confirm all live values have field-level provenance before marking the master record review-ready.
